

SCALE FOR PROJECT MINISHELL

You should evaluate 2 students in this team

Repository

git@vogaphere.43bangkok.com:vogaphere/1sttra-ws1d-f2f3\*

Introduction

Please comply with the following rules

- Be polite, courteous, respectful and constructive throughout the evaluation process. The well-being of the community depends on it.

- Identify with the student or group whose work is evaluated the possible dysfunction in their project. Take the time to discuss and debate the problems that may have been identified.

- You must consider that there might be some differences in how your peers might have understood the project's instructions and the scope of its functionalities. Always keep an open mind and grade them as fairly as possible. The pedagogy is useful only and only if the peer-evaluation is done seriously.

Guidelines

- Only grade the work that was submitted in the Git repository of the evaluated student or group.

- Double check that the Git repository belongs to the student(s). Ensure that the project is the one reported. Also, check that 'git clone' is used in an empty folder.

- Check carefully that no malicious scripts were used to fool you and make you evaluate something that is not the content of the official repository.

- To avoid any surprises and if applicable, review together any scripts used to facilitate the grading (scripts for testing or automation).

- If you have not completed the assignment you are going to evaluate, you have to read the entire subject prior to starting the evaluation process.

- Use the available flags to report an empty repository, a non-functioning program, a Make error, cheating, and so forth. In these cases, the evaluation process ends and the final grade is 0, or -42 in case of cheating. However, except for cheating, student are strongly encouraged to review together the work that was submitted, in order to identify any mistakes that shouldn't be reported to the tutors.

- Remember that for the duration of the defense, no explicit, no other unexpected, premature, uncontrolled or unexpected termination of the program, else the final grade is 0. Use the appropriate flag.

You should never have to edit any file except the configuration file if it exists. If you want to edit a file, take the time to explain the reasons with the evaluated student and make sure both of you are okay with this.

- You must also verify the absence of memory leaks. Any memory allocated on the heap must be properly freed before the end of execution. You are allowed to use any of the different tools available on the computer, such as leaks, valgrind, or s\_hack. In case of memory leaks, tick the appropriate flag.

Mandatory Part

Compile

Yes

No

- Use 'make -n' to see if compilation uses "libul -libatomic libatomic". If not, select the "invalid compilation" flag.

- minimal compile without any errors. If not, select the flag.

- The Makefile must not re-link. If not, select the flag.

Simple Command & global variables

Yes

No

- Execute a simple command with an absolute path like ./bin/a, or any other command without any options.

- How many global variables are used? Why? Ask the evaluated student to give you a concrete example of why these mandatory or logical.

- Check the global variable. This global variable cannot provide any other information or data access than the number of a received signal.

- Test an empty command.

- Test only spaces or tabs.

- If something crashes, select the "crash" flag.

- If something doesn't work, select the "incomplete work" flag.

Arguments

Yes

No

- Execute a simple command with an absolute path like ./bin/a, or any other command with arguments but without any spaces or double-quotes.

- Repeat multiple times with different commands and arguments.

- If something crashes, select the "crash" flag.

- If something doesn't work, select the "incomplete work" flag.

echo

Yes

No

- Execute the echo command with or without arguments, or the -n option.

- Repeat multiple times with different arguments.

- If something crashes, select the "crash" flag.

- If something doesn't work, select the "incomplete work" flag.

cat

Yes

No

- Execute cat command with or without arguments.

- Repeat multiple times with different arguments.

- Don't forget to check the minimal.

- If something crashes, select the "crash" flag.

- If something doesn't work, select the "incomplete work" flag.

Return value of a process

Yes

No

- Execute a simple command with an absolute path like ./bin/a, or any other command with arguments but without any spaces or double quotes. Then execute echo \$?

- Check the printed value. You can do the same in bash in order to compare the results.

- Repeat multiple times with different commands and arguments. Try some wrong commands like / bin/a \$RANDOM\$RANDOM

- Try anything like echo \$? + 42

- If something crashes, select the "crash" flag.

- If something doesn't work, select the "incomplete work" flag.

Signals

Yes

No

- ctrl-C in an empty prompt should display a new line with a new prompt.

- ctrl-^, in an empty prompt should not do anything.

- ctrl-D in an empty prompt should quit minimal => RESTART

- ctrl-C in a prompt after you wrote some stuff should display a new line with a new prompt.

- The buffer should be clear too. Press "Enter" to make sure nothing from the previous line is executed.

- ctrl-D in a prompt after you wrote some stuff should not do anything.

- ctrl-^, in a prompt after you wrote some stuff should not do anything.

- Try ctrl-C after writing a blocking command like cat without arguments or grep "something".

- Try ctrl-^, after writing a blocking command like cat without arguments or grep "something".

- Try ctrl-D after writing a blocking command like cat without arguments or grep "something".

- Repeat multiple times using different commands.

- If something crashes, select the "crash" flag.

- If something doesn't work, select the "incomplete work" flag.

Double Quotes

Yes

No

- Execute a simple command with arguments and, this time, use also double quotes (you should try to include whitespaces too).

- Try a command like echo "cat's | cat > lol.c"

- Try anything except 0.

- If something crashes, select the "crash" flag.

- If something doesn't work, select the "incomplete work" flag.

Single Quotes

Yes

No

- Execute commands with single quotes as arguments.

- Try empty arguments.

- Try environment variables, whitespaces, pipes, redirection in the single quotes.

- echo "\$USER" must print "\$USER".

- Nothing should be interpreted.

env

Yes

No

- Check if env shows you the current environment variables.

export

Yes

No

- Export environment variables, create new ones and replace old ones.

- Check the result with env.

unset

Yes

No

- Export environment variables, create new ones and replace old ones.

- Use unset to remove some of them.

- Check the result with env.

cd

Yes

No

- Use the command of to move the working directory and check if you are in the right directory with ./bin/a

- Repeat multiple times with working and not working cd

- Also, try "" and "." as arguments.

pwd

Yes

No

- Use the command pwd.

- Repeat multiple times in different directories.

Relative Path

Yes

No

- Execute commands both in the same relative path.

- Repeat multiple times in different directories with a complex relative path (lots of ..).

Environment path

Yes

No

- Execute commands both in the same env path (i.e., env, and so forth).

- Check the \$PATH and ensure commands are not working anymore.

- Set the \$PATH to a multiple directory value (directory1:directory2) and ensure that directories are checked in order from left to right.

Redirection

Yes

No

- Execute commands with redirections < and/or >

- Repeat multiple times with different commands and arguments and sometimes change > with <

- Check if multiple lines of the same redirection fail.

- Test <| redirection (it doesn't have to update the history).

Pipes

Yes

No

- Execute commands with pipes like 'cat file | grep bla | more'

- Repeat multiple times with different commands and arguments.

- Try some wrong commands like 'ls \$RANDOM\$RANDOM | grep bla | more'

- Try to mix pipes and redirections.

Go Crazy and History

Yes

No

- Type a command line, then use ctrl-C and press "Enter". The buffer should be clear and there should be nothing left to execute.

- Can we navigate through history using /p and /n? Can we rely some command?

- Execute commands that shouldn't work like 'ls \$RANDOM\$RANDOM'. Ensure minimal doesn't crash and plots an error.

- 'cat | cat | ls' shouldn't behave in a "normal way".

- Try to execute a long command with a lot of arguments.

- Have fun with that beautiful minimal and enjoy it!

Environment variables

Yes

No

- Execute echo with some environment variables (\$variable) as arguments.

- Check that 0 is interpreted as an environment variable.

- Check that double-quotes interpret 0.

- Check that \$0\$ exists. Otherwise, set 0.

- echo "\$USER" should print the value of the USER variable.

Bonus

OK

Outstanding project

Don't forget to check the flag corresponding to the defense

Empty work

Incomplete work

Invalid compilation

Name

Crash

Crash

Incomplete group

Concerning situation

Leads

Forbidden function

Can't support / explain code
